## Walter Advance Taps Provide Excellent Reliability and Performance

Brought To You by Walter Tools | Nov 04, 2019

*The universal **TC117** blind-hole and **TC217** through-hole taps tackle a wide range of materials.*

Walter has announced the introduction of the TC117/TC217 *Advance* cut taps for high threading productivity in a wide range of different materials. All Walter threading products have been divided into one of three categories: Supreme, Advance, Perform. The *Advance* line, where the new TC117/TC217 taps are positioned, signifies product that is efficiently balanced between price and performance, and offers the largest assortment with high stocking levels. *Perform* line tools provide an economical solution with focused importance on price. Applications where the price of the tool, and not the performance, is the most critical consideration is the focus for the Perform line taps. The *Supreme* line indicates the highest level of technology and performance available.

Walter TC117 (top) and TC217 taps for excellent reliability and advanced performance

Universal application tools, or tools that can be used in a variety of materials are available in the Supreme line, but this is also where application-specific tools are positioned. Taps customized for a specific material or application are branded in the Supreme line.

The versatile TC117 (blind-hole) and TC217 (through-hole) taps tackle material ranging from steel to aluminum (ISO material groups P, M, K and N), materials up to 370 HB and because of this versatility can help save on inventory costs by reducing the number of taps needed. The TC117 blind-hole tap has a 40° helix angle which allows tapping up to  $2.5 \times D_n$  with chamfer form C (semi bottoming) or E (full bottoming). The TC217 through-hole tap features a spiral point for forward chip evacuation and a thread depth capability of  $3.0 \times D_n$ . Both taps use HSS-E substrate that provides excellent durability due

to its cobalt enrichment.

The new sizes include UNC, UNF, STI-UNC, STI-UNF, UN, UNS, and M thread styles, giving these highly flexible taps an even wider range of application in a variety of materials. The taps feature a TiAlN coating (grade WY80RG) for good chip control, good wear resistance and higher cutting speeds and vaporized surface treatment (grade WY80FC), which sacrifices wear resistance and cutting speeds but offers much better chip control for stringy and difficult-to-control chips such as stainless steel.
